

## Today's discussion

- Appendix

- Model Structure

- Access Line Forecasts

- MOU Forecasts

- Wireless 3<sup>rd</sup> Party Forecasts

- Long Distance

- Consumer Analysis

---

## As a starting point, we forecast access lines and wireless subscribers using historical growth trends and third party forecasts

- The wireline forecast embodies only wireless erosion that has occurred to date; it also does not take into account the transfer of second lines to broadband DSL or cable modem service. We take these effects into account in the next steps

**Landline Forecast Using Historical Growth Rates**

The baseline residential historical growth forecast is based on historical growth in households, lines per HH, and HH telephone penetration from 1990 to 2000

**Wireless Third Party Forecasts**

We are currently using the DLJ forecast in the model

According to the FCC Annual Wireless Report (June '01), there were 110M wireless subscribers at YE 2000

Next, we identified two major factors that are likely contributing to the decline in overall residential market access line growth which we forecast with the aid of 3<sup>rd</sup> party reports

<b>Access Line Replacement*</b>	
	
<b>Description</b>	<ul style="list-style-type: none"> <li>• Decline in access line growth due to increased substitution of wireless for wireline (both primary and non-primary lines)</li> <li>• Residential only – business not included due to lack of adequate 3<sup>rd</sup> party forecasts</li> </ul>
<b>Sources</b>	<ul style="list-style-type: none"> <li>• IDC Replacing Landline with Wireless: How Far Can it Go? 2000</li> <li>• Yankee Group VoDSL: All Talk, No Action ... Yet, 2000</li> <li>• JPMorgan/McKinsey Broadband 2001</li> <li>• PCIA Global Wireless Portfolio 2000</li> <li>• MSDW The Broadband Report 2000</li> </ul>

\*NOTE: For the purposes of the USF model, we are not including the effect of competitive technology substitution from cable telephony and VoDSL. These technologies drive a shift from traditional land lines to non-traditional carriers but will not affect the total revenue from voice services. The USF national model derives aggregate end user industry revenues and thus should not exclude lines served by competitive technologies.

**Wireless substitution data from an IDC survey of 900 households indicates that wireless substitution for land lines is already substantial, and may grow considerably over the next several years**

- MOU displacement does not affect access line counts but is taken into account in the following section detailing MOU forecasts

### Wireless Substitution of Land Lines

Note: This forecast is for years 1999-2004. We have applied the CAGR for each type of landline replacement to these forecasts to yield the 2005-2006 forecast.

Source: IDC 2000 Telephony Service Data

In addition, data from the Yankee TAF 2000 survey suggests that roughly 18% of all wireless households would consider replacing at least one of their land line connections

**Approximately 8% of households (i.e., 44% penetration x 18% consider replacing) have at least one access line (primary or secondary) that is vulnerable to the wireless substitution effect**

After explicitly accounting for wireless substitution for both primary and non-primary lines, the base case landline forecast is 21% lower for residential lines in 2006

For broadband substitution, we have several nationwide cable modem and DSL projections which are in reasonable agreement in terms of subscribers. However, we must understand the likelihood of these broadband subscribers to cancel their 2<sup>nd</sup> access line

**US Cable Modem Subscriber Forecast**

We are currently using the average of the four forecasts in our model

**US DSL Subscriber Forecasts**

We are currently using the Yankee DSL forecast (broken into residential vs. business) in our model

Sources: Yankee Group, IDC, Strategis Group, JPMorgan/McKinsey, MSDW

\* IDC's new Worldwide Cable Modem Equipment and Services Market Analysis Forecast, released June 2001

Unfortunately the TNS data does not offer a good way to analyze broadband substitution, so we based our assumptions on broadband substitution rates on results from Yankee TAF and IDC

### Sources

#### Yankee TAF

- ~ 33% of multi-line users will drop for Broadband
- $33\% = 65\% * 35\% + (1/2 * 31\%)$

65% Multiline  
HH use line for  
internet

35% very  
likely  
to drop

31%  
somewhat  
likely to drop

#### IDC

- 90% of new Broadband users have multiple lines at time of Broadband purchase

- 35% of multi-line users drop a second line
- Bell South has seen roughly one-third of DSL subs cancel second lines

#### Our Assumptions

- 90% of new Broadband users have multiple lines at time of Broadband purchase

- 35% of multi-line broadband users drop a second line

After accounting for the two effects of broadband substitution (cable modem and DSL) and wireless replacement, the preliminary base case landline forecast is 23% lower for residential lines in 2006

Just as with the residential forecast, we project business lines based on historical growth as a starting point. We believe that the historical migration of business lines to special access for both voice and broadband is taken into account by using the historical forecast as seen here in the suppression in business line growth with special access line growth

*Landline Forecast Using Historical Growth Rates*

The baseline business historical growth forecast is based on historical growth in business lines from 1990 to 1999

*Business Lines vs. Special Access Lines (1988-1999 FCC SOCC)*

We therefore only need to account for effects on line growth from technologies not already included in the historical forecast. We view DSL as the main factor for business access lines

<b>Access Line Replacement*</b>	
	
<b>Description</b>	<ul style="list-style-type: none"> <li>• Decline in access line growth due to increased substitution of wireless for wireline (both primary and non-primary lines)</li> <li>• Residential only – business not included due to lack of adequate 3<sup>rd</sup> party forecasts</li> </ul>
<b>Sources</b>	<ul style="list-style-type: none"> <li>• IDC Replacing Landline with Wireless: How Far Can it Go? 2000</li> <li>• Yankee Group VoDSL: All Talk, No Action ... Yet, 2000</li> <li>• JPMorgan/McKinsey Broadband 2001</li> <li>• PCIA Global Wireless Portfolio 2000</li> <li>• MSDW The Broadband Report 2000</li> </ul>

\*NOTE: For the purposes of the USF model, we are not including the effect of competitive technology substitution from cable telephony and VoDSL. These technologies drive a shift from traditional land lines to non-traditional carriers but will not affect the total revenue from voice services. The USF national model derives aggregate end user industry revenues and thus should not exclude lines served by competitive technologies.

Using a Yankee Group forecast of business DSL subscribers, the business access line counts are approximately 5% lower in 2006

## Today's discussion

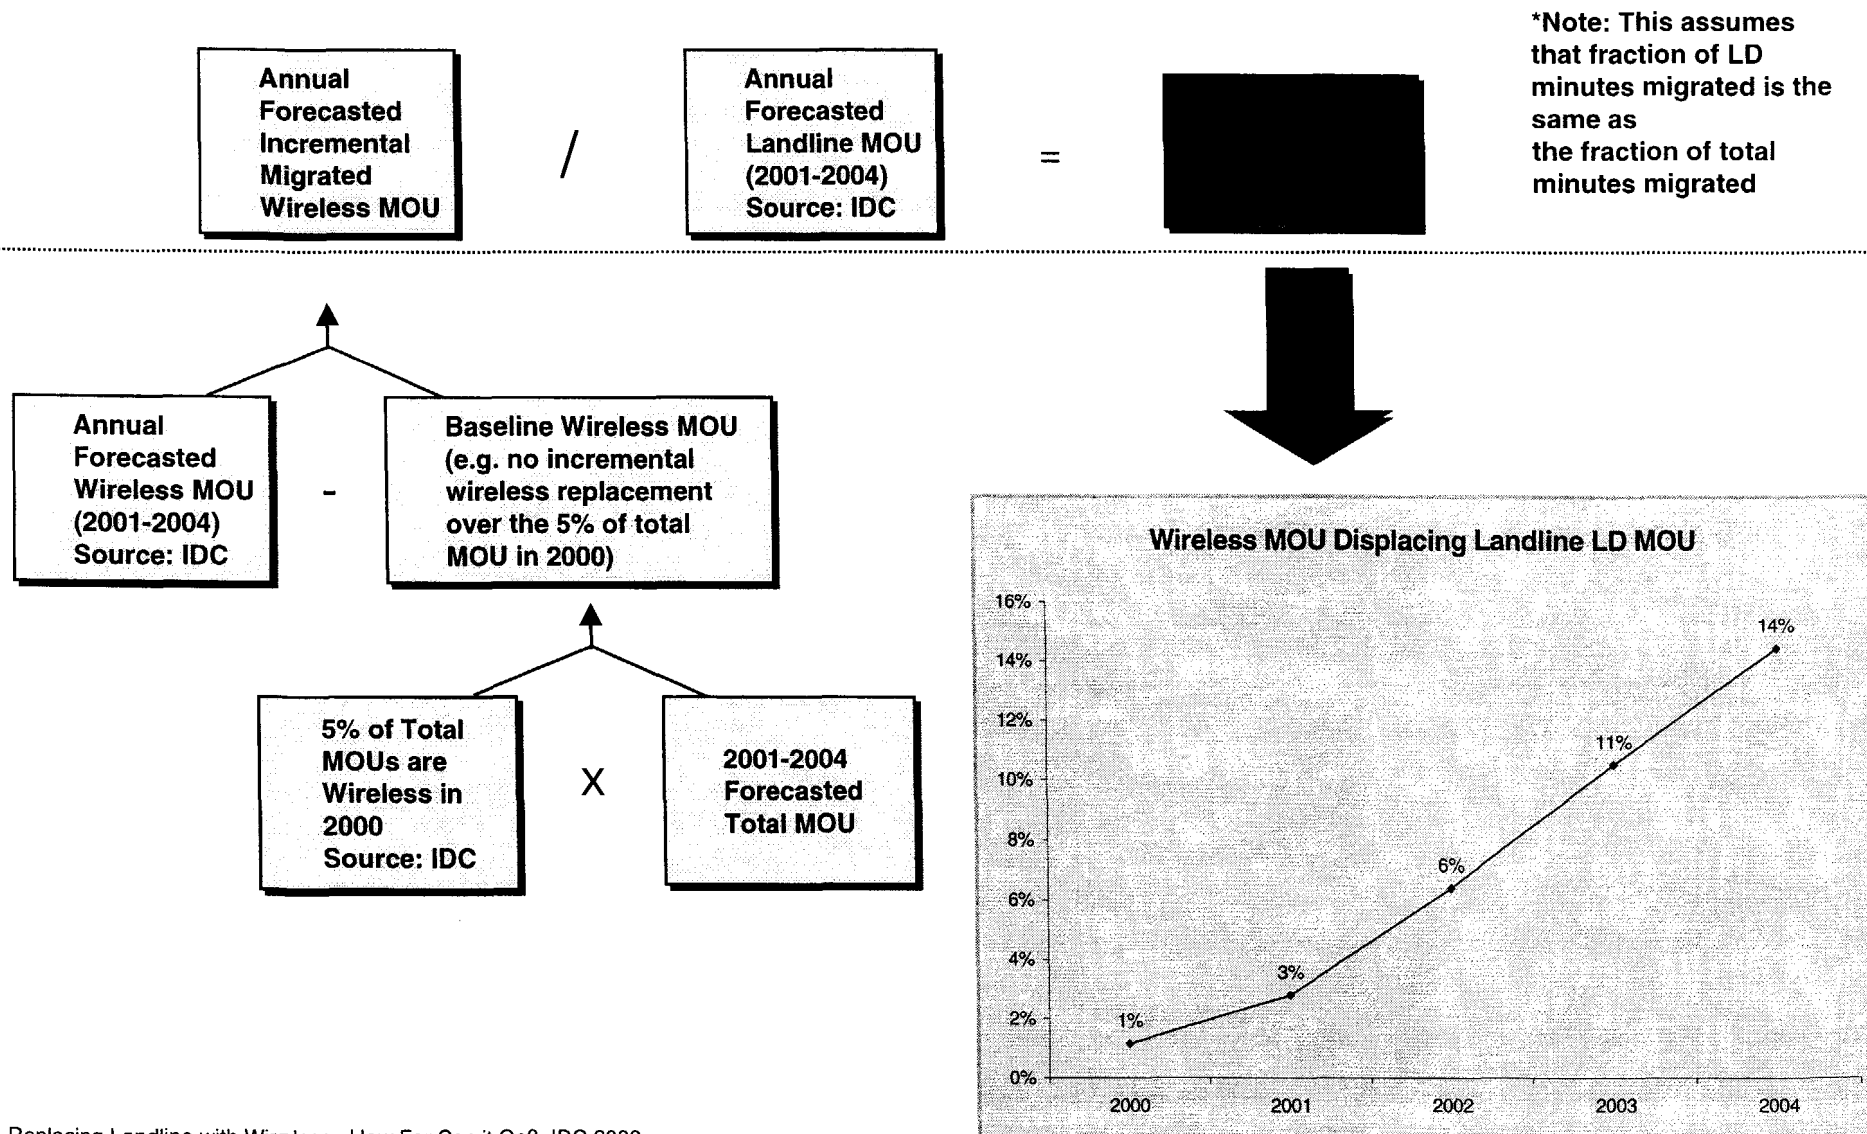

- Appendix

- Model Structure
- Access Line Forecasts
- ➔ – MOU Forecasts
- Wireless 3<sup>rd</sup> Party Forecasts
- Long Distance
- Consumer Analysis

We start with a forecast of LD MOUs based on historical growth and apply the effects of wireless migration and VoIP migration to develop a revised LD MOU forecast for both residential and business MOUs

<b>LD MOU Displacement</b>	
	
<b>Description</b>	<ul style="list-style-type: none"> <li>• Shift of wireline MOU to wireless as packages including LD become more common and rates decline</li> <li>• Residential only – business not included due to lack of adequate 3<sup>rd</sup> party forecasts</li> <li>• Shift of circuit-originated MOU to VoIP as VoIP technology becomes widespread and consumers take advantage of lower rates</li> <li>• Residential and business</li> </ul>
<b>Sources</b>	<ul style="list-style-type: none"> <li>• Yankee 2000</li> <li>• Yankee TAF Survey 2000</li> <li>• IDC Replacing Landline with Wireless: How Far Can it Go? 2000</li> <li>• Yankee Group VoDSL: All Talk, No Action ... Yet, 2000</li> </ul>

Our preliminary approach to the wireless displacement of residential LD MOUs is based upon the current and forecasted breakdown of total US minutes into wireless and wireline minutes

In addition, LD MOUs migrated to VoIP decrease traditional LD MOUs. One approach to quantify the effect is based on a JP Morgan forecast of domestic distribution of LD minutes by technology (i.e. circuit-switched, special access, VoIP, wireless)

Domestic Only VoIP MOU Displacement – based on JP Morgan 2000

An alternative approach using an IDC forecast of total VoIP domestic and International LD MOUs results in similar percentages of LD MOU displaced although slightly higher because this forecast contains International MOUs as well

### Domestic & International VoIP MOU Displacement – based on IDC 2000

Sources: VoDSL: All Talk, No Action...Yet, Yankee Group 2000

IP Telephony Services: Market Forecast & Analysis, 1999-2005, IDC 2000

## Our residential LD MOU forecast demonstrates the dramatic impact of wireless and VoIP displacement by 2006 on residential MOU

Note: The resulting 65 MOUs is derived using the more conservative IP telephony forecast. The MOU displacement effect would be larger if the more aggressive forecast is used

**VoIP technologies will also significantly reduce business MOU by the end of the forecast period**

Note: The resulting 586 MOUs is derived using the more conservative IP telephony forecast. The MOU displacement effect would be larger if the more aggressive forecast is used

## Wireless usage for business purposes: A survey by The Yankee Group in 2000

- Question: What is the most important reason you first bought, leased, or acquired a wireless phone?

In addition, on average, **72%** of calls are personal, **28%** are business; percentages are the same as 1999 results.

Base: Wireless Phone Users

Source: Yankee 2000 Mobile User Survey, The Yankee Group

## Today's discussion

- Appendix

- Model Structure
- Access Line Forecasts
- MOU Forecasts
- Wireless 3<sup>rd</sup> Party Forecasts
- Long Distance
- Consumer Analysis

## Long distance minutes of use per line assumptions are derived from FCC data

Intra-LATA Intrastate	33
Inter-LATA Intrastate	19
Intra-LATA Interstate	1
Inter-LATA Interstate	55
International	2
Other	5
<b>TOTAL</b>	<b>115</b>

Lines per HH

Intrastate	40
Interstate	48

Intrastate Toll	451,000,000,000
Interstate Toll	585,000,000,000

DEMs are converted to MOUs using an adjustment factor. Residential toll minutes (derived from the toll minutes per HH and lines per HH) are then subtracted from the total toll minutes to obtain business toll minutes.

Intrastate	244
Interstate	292

The residential and business MOUs per line are forecasted using the historical growth rate. The effects of wireless and VoIP displacement are then taken into account as described earlier in the Appendix

## Long distance average price per minute assumptions are derived from FCC data as well

Average Domestic & International LD Price per Minute

- This graph blends:
  - Business and residential rates
  - International and domestic rates

Forecasted LD Price Per Minute

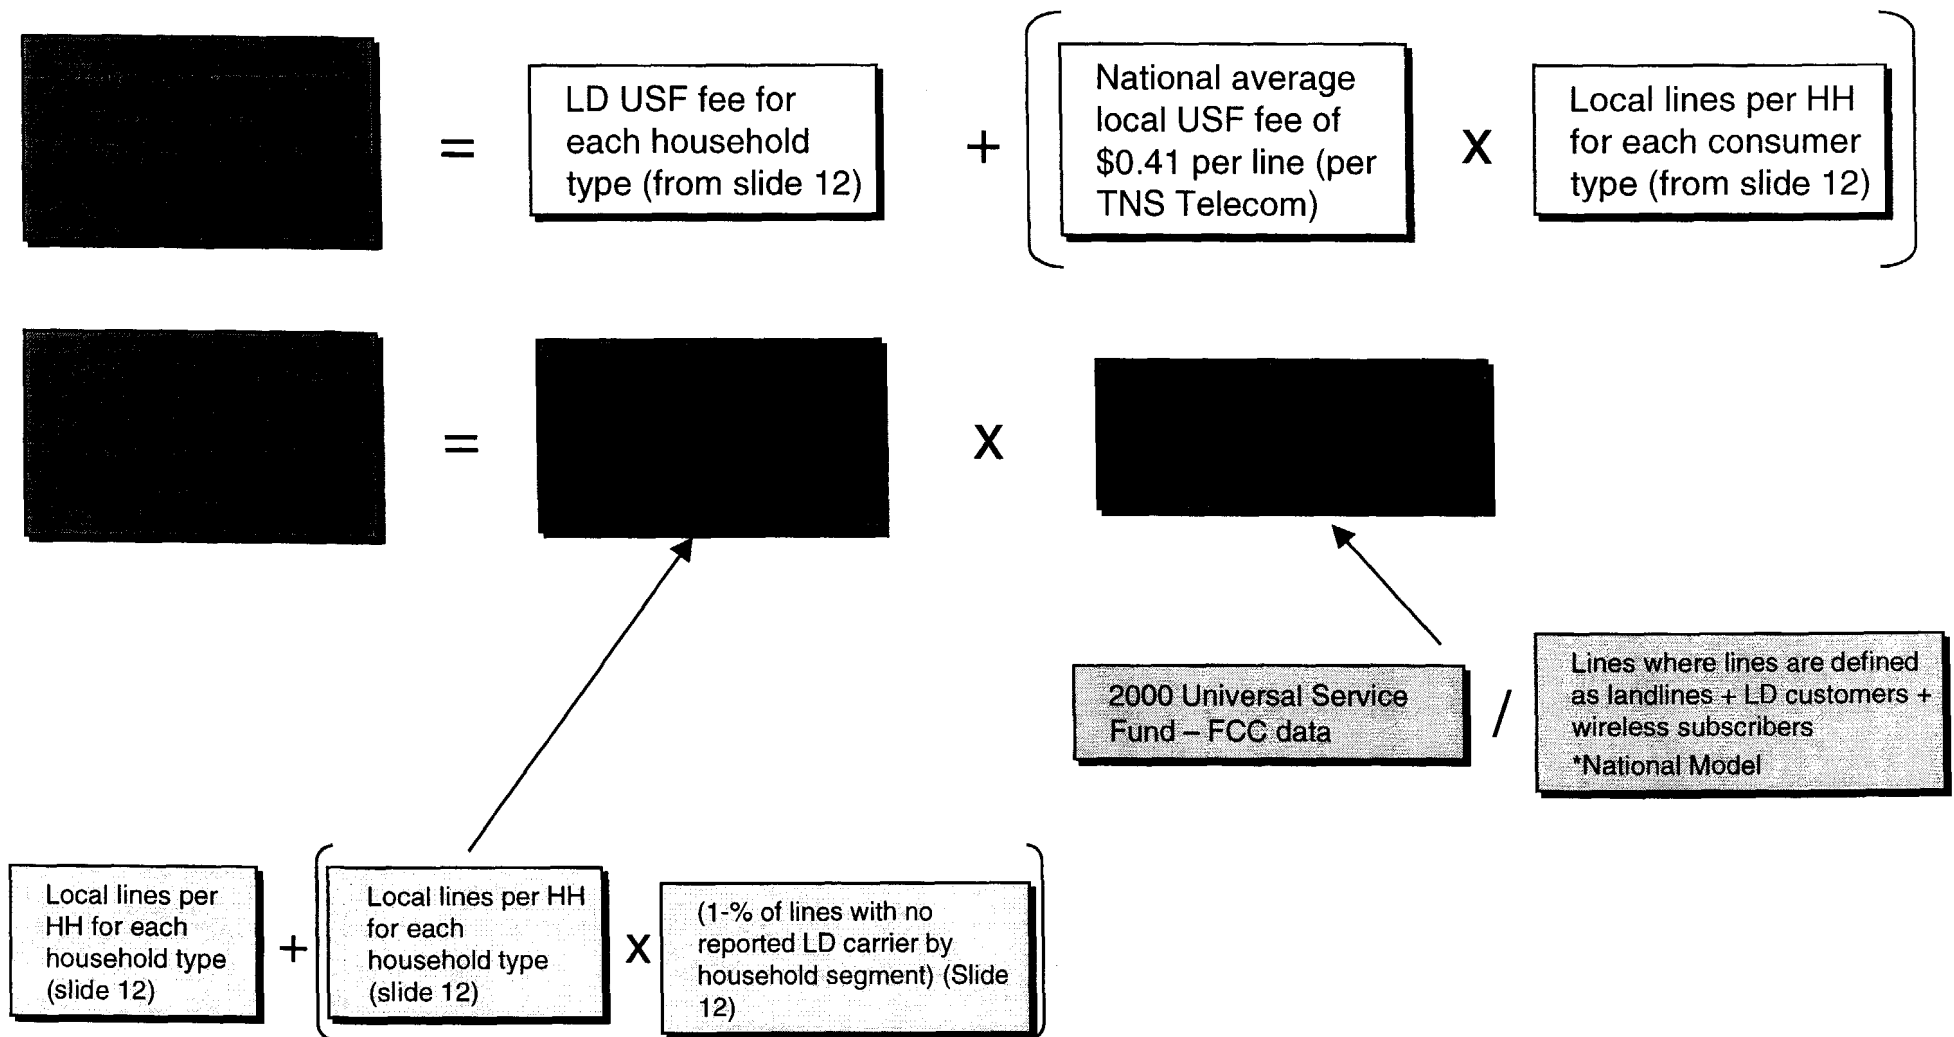

- This graph blends:
  - International and domestic rates
  - Single line and multi line business rates
